---

Is there some alternative way to play it? A: The standard DV video plugin is not working with the DDJ-ERGO V controller. But you can use the free Virtual DJ 7 LE to play tracks using the "straightjack" connection mode and the track you will be playing will be synced to the disc. The DDJ-ERGO V controller can be programmed with two controls: left/right pad and top/bottom pad. The top and bottom pads are used to switch the track. However, I would recommend using the Virtual DJ LE, because the release the media disc track is rather long to be done in a DJ set. The DJ software plays the track from the beginning to the end.

You have to stop, change the track and start again. Q: SSH connection with private key to remote server When I'm trying to connect to remote server via SSH and use key, it's not authenticating. I did sudo apt-get install openssh-server and when i try ssh -p 2222 server it says connection refused but if I manually type the ip address of server with port 2222 on my local network on firefox it's connecting and so it is with my phone. It's an Ubuntu server. I think the problem is when I try to make the connection with the key it's not asking for my password because it's a new connection to the server. If you use a key pair, you have to add the following in your ~/.ssh/config: Host server IdentityFile ~/.ssh/id\_dsa.pub Hosting HostName server.example.com User ubuntu Port 2222 In this example, you can connect from localhost or the other IP address as long as it is in the same network. If you don't need the password for the other servers, you can use no-password mode of SSH with the following command. This is not recommended since you would be vulnerable to brute-force attacks. ssh -o ServerAliveInterval=30 -o ServerAliveCountMax=2 -o ExitOnForwardFailure=yes server.example.com If you want to use the password, you can setup a pub-key authentication method. You can use a file with the following format in your local ~/.ssh/id\_rsa.pub: ssh- 82157476af
